So, how do builders build now?

We noticed that something strange is happening. We're all writing software with AI, but we are mostly doing it alone, with no real sense of how anyone else does it.

So we made a tool to help you understand how you build with AI.

It reads your Claude, Codex, and Cursor sessions, so you can discover things about how you build.

With time, as more people upload theirs, we'll be able to show you how you compare to other builders.

So far, 1,108,347 sessions have been uploaded and analyzed.

Examples of what people have learned about their coding habits

- **Which archetype are you?** The Architect. You plan first, codify your decisions, and build scaffolding that compounds.
- **Which model do you use most?** You love Opus 4.7 Fast. You reach for Opus 4.7 in 72% of your sessions, GPT-5.5 in 22%.
- **When are you most productive?** Night owl. 70% of your commits land between 10 PM and 2 AM, peaking around 11 PM.
- **How often do you plan?** 62% in plan mode. You open in plan mode before writing code, skipping it on quick fixes.
- **What's your go-to prompt?** "make it prettier". Your most-used phrase, across 11 different sessions.
- **How many agents do you run?** 6 agents in parallel. You've run as many as 6 coding agents at once across 4 repos.
- **How long are your prompts?** Straight to the point. 80% of your prompts are under 10 words. You say a lot with a little.
- **Your most cryptic prompt?** "make teh other thing wrok not this 1". You sent this at 1 AM with zero context. The agent somehow figured out what you meant.
- **How polite are you to your agents?** You thank all the time. You thanked your agents 84 times in the last month. When the robots take over, they'll remember you fondly.
- **How often do you change course?** You steer, hard. You stop and redirect the agent mid-task rather than let it run off, about 4 prompts in 10.
- **What's your longest agent run?** 4h 12m. One agent spent over four hours straight chasing a flaky test suite before you stepped in.
- **What's your biggest crash out?** "I LITERALLY SAID DONT TOUCH THAT FILE". After the third time it ignored you, the caps lock came on and never went back off.
- **How much did you ship?** 47,000 lines. Across 420 commits and 35 pull requests in the last month.
- **How do you see your agent?** Like a design partner. You bounce ideas before writing code, ask for pushback, and change course when it disagrees. Less tool, more teammate.
- **When do you ship most?** Tuesdays. Your single biggest push of the month landed on a Tuesday.

Two ways to upload coding sessions

It looks at the AI session transcripts on your computer. Where you run the command tells it whether to analyze every project at once or just one.

All my repos (recommended):

```
curl -fsSL https://paxel.ycombinator.com/upload.sh | bash
```

Just one repo:

```
cd ~/path/to/your-project && curl -fsSL https://paxel.ycombinator.com/upload.sh | bash
```

What you get

A builder profile across five dimensions of steering, execution, engineering, product instinct, and planning, plus the archetypes we see, your decision patterns drawn from real

exchanges, and a growth edge grounded in your actual sessions.

One command, runs locally

Sign in with your email, then run the command in your terminal from the repo you want analyzed. The analysis runs in Docker on your own machine, so you'll need Docker installed and running first. In about 15 to 30 minutes you get your profile back. Your code never leaves your machine.

Common questions

- **Is YC reading my code?** Your working tree and .env files are not uploaded to YC. During analysis, transcript excerpts (prompts, agent responses, and snippets of tool calls) are sent to Claude or GPT via our proxy so we can summarize what happened. At the end of the run, a JSON payload of scores, narratives, redacted decisions, and session metadata is uploaded to YC. Full breakdown.
- **What coding tools does it work with?** Claude Code, Codex CLI, and Cursor. We read the transcripts each tool stores locally.
- **Do I need Docker?** Yes. The analysis runs locally in a Docker container on your own machine. Install Docker Desktop (or any Docker runtime like colima or OrbStack) and make sure it's running before you run the command. If the engine isn't up, the script prints exactly how to start it.
- **Does it cost anything?** No, it's free.
- **How long does it take?** 15-30 minutes depending on how many sessions you have. You get an email when it's ready.
- **Can I upload from multiple repos?** Yes. Run from a parent directory and pick which repos to include, or pass --project NAME.
- **How often should I upload?** Whenever you want an updated profile. Each upload produces a new report; your profile aggregates across all of them.
- **What's the difference between a report and a profile?** A report is a snapshot of one upload. Your profile synthesizes patterns across all your reports: how you've evolved, what's consistent, where you're growing.
- **I code on multiple machines. Can I get credit for both?** Yes. Just run the same curl command on each machine. Log in with the same email and your builder profile will automatically aggregate sessions across all of them.
- **How do I attach my Paxel token to my Startup School application?** Linking your Paxel token boosts your chances of getting into Startup School 2026. Open your reports page and find your token. If you haven't applied yet or you're still on the waitlist, click the attach link to send your token straight to your application, or copy the token and paste it in yourself.
- **Why did the way I log in change?** Paxel sign-in now goes through your Y Combinator account at account.ycombinator.com instead of a separate Paxel-only login. Tying each account to one verified YC identity keeps your reports with you even if your email changes, and it lets you link your Paxel token to your Startup School application. The old email sign-in is going away on August 10, 2026.
- **What happens if I don't migrate my Paxel account to YC SSO by August 10th?** The old email sign-in turns off on August 10, 2026. After that you won't be able to log in or reach your existing reports, and you'd have to create a new account with Sign in with Y Combinator and upload your sessions again. Migrating before the cutoff keeps your existing reports and token.
- **How do I migrate my Paxel account to Sign in with Y Combinator?** Log in to Paxel before August 10, 2026 and click Migrate account in the banner at the top of your dashboard. You'll confirm through account.ycombinator.com, and your existing reports and token carry over automatically. From then on, use the Sign in with Y Combinator button to log in.
- **My YC account email is different from my Paxel email – what happens?** That's fine. If your YC account uses a different email than your Paxel account, we show you both and ask you to confirm before linking anything. Choose Link anyway to connect them – your existing reports and token carry over. Choose Cancel and nothing is linked; your account stays exactly as it is.
- **I found a bug or have a feature request. Where do I send it?** Use this form to report a bug or request a feature. For feature requests we like, we'll run your prompt with a coding agent and merge the result.

Report a bug or submit a feature request

Tell us if you found something broken or want this tool to do something it can't yet. For feature requests we like, we'll run your prompt with a coding agent and merge the result.
